

PNP IBTS — Demo Walkthrough

Integrated Benefits Tracking System · Prototype

A step-by-step guide for demonstrating the Integrated Benefits Tracking System prototype. Everything runs locally on a mock API — no backend required.

Note: This is a prototype. Authentication and role gating are demonstration conveniences, not a real security boundary.

Getting started

```
npm install
npm run dev
```

Open `http://localhost:3000` — you'll land on the login page.

Demo accounts

Role	Email	Password
Admin	j.reyes@ibts.local	admin123
HR Manager	a.cruz@ibts.local	hr123
Officer	s.bautista@ibts.local	officer123
Retiree	r.domingo@ibts.local	retiree123
Dependent	m.cruz@ibts.local	dependent123

The login page also lists these under “Demo accounts”.

Suggested walkthrough (~8 min)

1. Admin — the full picture (*admin123*)

- **Dashboard:** profile hero, service-years chart, promotion timeline, benefits summary, and action-required feed.
- **Personnel:** click **Add Account** to create an Officer (rank + service years) or Dependent (relationship + sponsor). New records appear immediately. Click **Edit** on a row to change rank/status.
- **Claims:** open a *submitted* claim → **Start Review** (status flips to under review) → **Proceed to Decision** → Approve/Reject.
- **Financial:** KPI cards + charts. Click **Export CSV** to download a report.
- **Audit Log:** every action above is recorded here.

2. HR Manager — approve, read-only reporting (*hr123*)

- Same claims powers as admin (review + decide).
- **Financial** and **Audit** are read-only — no Export button.

3. Officer — request a claim (*officer123*)

- Sidebar is trimmed to what officers can see.
- **Claims** is titled **My Claims** — only their own claims show.
- Click **New Claim Request** → pick a benefit → submit. Log back in as admin/HR to see it in the full list.

4. Retiree (*retiree123*)

- Retirement-focused dashboard; can view the Retirees directory and submit claims for their own benefits.

5. Dependent — verification focus (*dependent123*)

- A slimmed dashboard: verification status, required documents, sponsor, and beneficiary insurance benefits.
- Click **Request Re-verification** to resubmit — this notifies admins.

Things to point out

- **Role-based access:** the sidebar and action buttons change per role.
- **Realistic states:** the mock API adds latency and occasional errors, so you'll see loading skeletons, empty states, and retry UI — that's intentional.
- **Global search** (header): role-scoped; try a name or claim ID.
- **Notifications** (bell): unread badge; submitting a claim notifies both the submitter and admins.

- **Settings:** edit profile, change password (works on next login), view account details.
- **Theme:** light/dark toggle in the header.

Persistence & reset

Mock data persists in the browser, so changes — new claim requests, decisions, created accounts, notifications — survive reloads and logout/login. This is what lets an officer submit a claim and an admin see it after switching accounts.

To reset to the seeded demo data, clear the site's local storage (browser DevTools → Application → Local Storage → remove the `ibts-mock-db:1` key) and reload.
